

Continuous ATO with Wabbi

IMPLEMENT

Developers are provided with their feature-level policies, controls, and the ability to provide feedback on implementation in their IDE

ASSESS

Wabbi evaluates security test results against the assigned policies and controls.

SELECT

Policies are automatically selected for the project based on the project profile

CATEGORIZE

The product owner completes a survey in Wabbi to assign a project profile which will dictate project-specific ATO security requirements

AUTHORIZE

Release tools call on Wabbi to check if it meets the security standards. If not, stakeholders are notified and can view the outstanding issues

MONITOR

Wabbi checks controls on regularly scheduled intervals to ensure code is still in compliance.

Additionally, it continues to monitor the outstanding security debt and will notify stakeholders when it is out of compliance with remediation SLAs.

As policies are updated, impacted projects are notified and ATO status is updated
